

MLBi2

The small bright telescope

MAGNIFICATION:
2.0, 2.5 dioptres

VISUAL FIELD:
At 2.0 20°, at 2.5 15°

WEIGHT: 38 grams

CORRECTION LIMIT:
+10 – 6 dioptres

WORKING DISTANCE:
– 2 metres

A small telescopic system in the upper edge of the frame produces a magnified image of an object at a distance when the head is tilted forward slightly.

This system offers a convenient way to use your normal glasses with a magnifying power that is only in the field of vision when you purposely bend your neck forward and raise your eyes.

With its small, lightweight design, the system allows you to quickly gain a better picture of road signs, a face, a street number and so on.

Weighing a mere 38 grams, it can be fitted into most frames. For optimum performance, however, we recommend a deep frame worn high on the nose.

CORRECTION AND FILTER

Glasses and magnifiers/housing are available with correction power (both front and rear sections to provide the best possible visual acuity) and can be fitted with a filter in any of our filter colours.

- The magnifiers are mounted through the lens for optimal visual field and comfort. The housing is 13 mm in the smaller section closest to the eye and 21.7 mm in the outer section.
- The laser method gives an exact fit for the best possible vision and comfort.
- Magnification 2.0x, 2.5x
- Anti-reflective, scratch-resistant multi-coated lenses
- Anti-reflective coating on the inside of the housing. The housing is available in black or transparent.
